

Benefits

- ☑ Reduces job time
- ☑ Reduces waste and costs
- ☑ Improves management systems
- ☑ Improves productivity

The all-in-one software specifically designed for waterjet cutting

Softec™ Waterjet Software has been developed by Techni Waterjet with two very clear goals in mind:

- *To cut parts at the minimum cost with the greatest accuracy.*
- *To have a simple and intuitive interface with the operator.*

Functions included in Softec™ Waterjet Software by TECHNl Waterjet™

DXF Importation: Softec™ will recognize DXF files from all common CAD packages. This will allow for a rapid “drawing to part” process, that is extremely simple and easy to use, by either networking of computers or downloading with CD or USB connection. When importing DXF files, Softec™ will “cleanup” the files automatically. It can also convert the thousands of small lines from scanned images into arcs and curves.

Automatic Functions: Softec™ can automatically apply straight or curved lead ins and lead outs, kerf compensation, square corners and automatic tabbing. Naturally these can also be manually added or edited.

Dynamic Wear Compensation: this will ensure the first part is as accurate as the last part made during the life of the focusing tube. The computer will automatically adjust the Kerf width compensation as the focusing tube wears.

Set Plate Orientation: no need to line up your material, as the computer will automatically compensate - then simply jog to any two points along the material and the computer will do the rest.

Standard Objects: select from a list of standard objects, and simply add the dimensions you require. Gaskets, flanges, boxes, cones and other standard objects can be produced on the computer in seconds.

Standard Library: If you have objects or shapes that you produce regularly, simply add them to your library and bring them into a new project quickly and easily.

Multiple Piercing Options: low pressure piercing for brittle materials, Dynamic piercing for minimum piercing time, Static piercing for very tight nests or small parts and No Piercing for “On the fly”, pre-drilled or “Off the Edge” applications.

Re-Start Cutting from Anywhere: if at any time for any reason the cutting process is stopped, you can simply find the last line that was cut successfully and have the program continue to cut from that point.

Simple Troubleshooting: a comprehensive Alarms Window to inform you of any potential machine faults. A log of the time and details is presented, making diagnoses quick and easy, and maintenance simple.

Tru-Cut Technology™

At the “Heart” of Softec™ is Tru-Cut Technology™, a highly sophisticated algorithms database that determines the optimum cutting speeds and machine ramping characteristics.

Once you select the material to be cut, its thickness and surface edge finish required, the computer will take care of the rest, ensuring the minimum cutting time for any given part. (Note: you can also add new materials)

A GMM Group Company

Array Nesting: this allows you to rapidly nest parts in a grid pattern. Any number of different objects can be simply added to the nest.

Auto Nesting: parts will be automatically nested onto the sheet to optimize material usage. Parts can be nested into other parts. Editing is fast and simple with “drag and drop”, add object, rotate, delete and move order functions.

Multiple Origin Points: the auto start and cycle counter, allows for production from multiple fixtures. Ideal for batch runs where the operator can load/unload while the machine is cutting on another fixture.

Dry Running: allows you to physically run around the job with the cutting head turned off. This can be done much faster than at the cutting speed and is ideal to check location on a remnant piece of material. Can be started from anywhere on the program.

Five Different Edge Qualities: a choice of Individually selectable edge qualities for each line of a part. Using color coding for the different qualities, it is easy for the operator to set different finishes for different areas of a part. For example, clearance holes could be cut with a “Coarse” finish while holes to be tapped would be cut with an “Extra Fine” finish. This will optimize the cutting time, dramatically increasing your output.

Jog and Inch Functions: the machine can be easily “jogged” to a predetermined position or “inched” an exact amount.

Manual Override while Cutting or Jogging: if while cutting you decide you want to move faster or slower, simply slide the “Adjustable Override” tab to the speed you desire.

Maintenance Timers: Softec™ will record the actual running and cutting times to determine how long between consumables and maintenance changes - ideal for preventative maintenance.

Design Mode: while the machine is cutting you can be preparing the next job, greatly increasing your productivity.

Pause Before Pierce and Pause After Cut: lets you remove or inspect after each cut, without interrupting the program.

Simulation: run jobs “On the Screen” first, to ensure no errors, before potentially wasting material. Great for costing and quoting as the exact time to cut the part can be verified, and different set-ups can be checked to see exactly how they will affect the overall cutting time.

Costing Properties: will determine the exact cost per hour to operate your machine, or the exact cost per part. Includes all consumables, maintenance, utilities costs, material costs, labor and depreciation.

Off Site Notification: for long jobs, the auto Dialer enables the computer to send a text message to your phone in the case of a machine fault. When used in conjunction with Tech-Sense™ this makes “Lights Out” production a reality. (Optional)

3 Simple Steps to bring your ideas to life. Import DXF or start from scratch.

Step 1 : Select Material

The software automatically loads the pre-defined settings to cut the particular selected material.

Step 2 : Input Dimensions

Input the dimensions of the material thickness, length and width of the sheet to be cut.

Step 3 : Confirm Configuration

Confirm your machine configuration and press go, your waterjet machine will do the rest.

All-In-One Package

One of the best features of Softec™ is that you get all of these functions in the one single software package, with no need to jump between softwares. As the Techni Software developers continue to improve and implement new features, you will get these benefits on future upgrades.

FEATURES

- Dxf
- Five edge qualities
- Auto and array nesting
- Multiple piercing options
- Cad package
- Costing & estimating package
- Real time running simulation
- Trouble shooting diagnostics
- Standard object library
- Maintenance timers

3D View feature with 360° degree object rotation

3D OBJECT

BEVEL SHEET

Softec Nest™ utilizes advanced nesting algorithms which have been developed by one of the world's largest and most awarded CAD and nesting software developers.

FEATURES

- ✓ Grid nesting
- ✓ Corner nesting
- ✓ Sheet utilization percentage
- ✓ Multiple remnant options
- ✓ Multiple sheets
- ✓ Collar width control
- ✓ Mirror objects
- ✓ Infinite step angle cont
- ✓ Cutting sequence generation
- ✓ Preferential hole filling

BENEFITS

- ➔ Improves Profitability by increasing material yield
- ➔ Improves Profitability by minimising rapid feed times
- ➔ Improves Profitability by increasing nesting speed
- ➔ Improves Profitability by increasing remnant size

Utilization

Time to Nest

Quantity of Nested Parts
